

AI Architecture Presentation

Slide 1: Executive Summary

Overview

- **Topic:** Autonomous AI Architecture for Enterprise Systems
- **Framework:** Hermes Agent (INDRA AI)
- **Target:** Scalable, secure, multi-agent AI infrastructure

Key Objectives

- Deploy autonomous AI agents with persistent memory
- Enable multi-agent collaboration and orchestration
- Ensure security, scalability, and maintainability

Technology Stack

- **Core:** Python 3.12+ with Hermes Agent framework
- **Agents:** Parallel subagent delegation with isolated contexts
- **Memory:** Persistent session memory with compression
- **Skills:** Procedural memory for recurring tasks
- **Cron Jobs:** Scheduled autonomous task execution

Slide 2: Architecture Components

Core Components

Component	Description	Responsibility
Hermes Agent	Main orchestration layer	Task coordination, context management
Subagents	Parallel isolated agents	Specialized work in parallel
Skills	Procedural knowledge base	Task-specific workflows and tools
Memory	Persistent fact storage	Cross-session state preservation
Cron Jobs	Scheduled execution	Background autonomous tasks

Communication Flow

Key Features

- **Isolation:** Each subagent has dedicated terminal session and toolset
- **Parallelism:** Up to 10 concurrent subagents for complex workstreams
- **Context Awareness:** Skills loaded automatically for relevant tasks
- **Memory Injection:** Facts persist across all sessions

Slide 3: Implementation & Deployment

Setup Requirements

```
```bash
```

### Prerequisites

---

- Python 3.12+
- Hermes Agent framework installed
- Project workspace configured
- Output directory: ./outputs/

```
```
```

Deployment Workflow

1. **Initialize Project** - Create or switch to desired workspace
2. **Configure Skills** - Define procedural knowledge via SKILL.md files
3. **Define Agents** - Create cron jobs with skills and schedules
4. **Deploy Subagents** - Use `delegate_task` for parallel workstreams
5. **Monitor** - Track execution via process polling and logs

Quality Assurance

- **Verification:** Format-aware readers verify PDF/PPTX/DOCX outputs
- **Testing:** Systematic debugging with 4-phase root cause analysis
- **Security:** Code review before deployment with auto-fix capabilities
- **Documentation:** Comprehensive system architecture documentation

Next Steps

- [] Deploy to production environment
- [] Set up monitoring dashboards
- [] Configure backup and recovery procedures
- [] Document operational runbooks
